

Module 3 - Building Hooks From Angles

[Click here for Google Doc \(Click File > Make a Copy\)](#)

Introduction ►

In the last lesson, we broke down what makes a **hook** work, why **hooks** matter on Meta, and the most common reasons they fail.

At this point, you should understand what a good **hook** needs to do.

In this video, we're going to focus on how to actually build them.

We are going to turn the ad **angles** you've already mapped out into clear, effective **hooks** you can write consistently, without guessing or trying to be clever.

I'm going to give you a simple builder framework and worksheet you can use to convert any **angle** into multiple **hooks** on demand.

The amazing thing about this is it gives you a clear path from onboarding > **Angle** Creation > **Hooks** so you will always have a clear plan of what to launch and test with every account you run.

If you've ever stared at a blank page trying to "come up with a **hook**", this lesson is going to remove that friction completely.

Let's get into it.

Angles To Hooks Framework

Every **hook** you create is going to start with your **angle**.

You already have all the information you need and we're not creating anything new here.

We're simply translating an **angle** into the first 1–2 lines of an ad.

Think of it like this:

Angle = the idea

Hook = the first expression of that idea

Our job is to take one **angle** and express it clearly, quickly, and with enough contrast to earn attention.

To do that consistently, we're going to use a small set of building blocks that every strong **hook** is made from.

Components

Every effective **hook** is built from the same core components.

You won't always use all of them, but you should always know which ones you're using and why.

The components are:

- Subject
- Action
- Outcome / Result
- Contrast
- Proof (optional)
- Time (optional)

We can map any **angle** against these 6 core components to create multiple **hooks**.

This means we aren't guessing what to say but are able to assemble our **hooks** from the core inputs that come directly from our audience's psychological states.

While you might be wondering if you could just pull **hooks** together from the **angles** sheet, the answer is yes you could, but with a downside.

Using this structure is going to force **clarity** and contrast into your **hooks** and give you structure and discipline for building and testing them.

Subject

Who is this about? In most Meta ads, this is usually:

- "You"
- "Busy professionals"
- "Business owners"
- Or implied "people trying to lose weight"

If the subject isn't obvious, the **hook** won't feel relevant.

Action

What's happening or changing? Must be a verb

- Losing weight
- Staying consistent
- Following a system

Every **hook** needs movement or something happening.

Outcome / Result

What do they want?

- Finally losing weight
- Keeping it off

- Feeling in control

Clear outcome = clear reason to watch.

Contrast →

Old baseline belief vs new reality

- Trying and quitting vs accountability
- Willpower vs system
- Motivation vs structure

This is where we build our contrast and make the **hook** compelling.

Proof (optional) ✓

- Clients / Track record
- Experience “After doing X”
- Volume
- “Used by”
- “again”

Time (optional) ⌚

How fast does this happen?

- In 30 days
- If I had 12 weeks
- Right now
- Before you build it

Hook Assembly ⚓

Here is my golden rule to follow when first assembling your **hooks**.

Remember this is designed to keep things simple and effective, while working out which key messaging points resonate with your audience.

We don't want to be too clever. Simplicity is key.

Sentence 1 – Clarity ✓

Subject + Action + Outcome.

The first sentence tells the viewer exactly what the video is about and who it is for. Keep it direct and specific.

Sentence 2 – Curiosity 🤔

Contrast (+ optional Proof or Time)

The second sentence builds contrast and gives the viewer the information they need to decide whether to keep watching.

Worksheet 📄

Now we're going to put this into practice.

Now let's take a look at the worksheet and build some of these together using the previous **angles** we created. It's designed to remove all guesswork from writing **hooks**.

By the end of this worksheet, you should have 5–10 usable **hooks** per **angle** that you can immediately test.

Now let me show you how to use it!

Summary ✓

Every **hook** starts with an **angle**. The framework in this lesson gives you a reliable way to translate any **angle** into multiple **hook** variations without guessing. Subject, action, outcome, contrast and these four components do the structural work. Proof and time add weight when you have them.

Sentence 1 carries **clarity**. Sentence 2 carries curiosity. Keep them separate, keep them simple, and use the worksheet to build five to ten **hooks** per **angle** before you launch anything.

The goal is not one great **hook**. The goal is a testing inventory that gives the algorithm enough signal to find the people who respond.

In the next lesson we are going to move from **hooks** into the full ad structure and how to take someone from attention all the way through to a click.
